

TRUTH TECHNOLOGIES EMPLOYMENT OFFER:

Web Developer

Truth Technologies, Inc. is looking to hire a new permanent team member to join the small IT team supporting the company's main application: Sentinel.

Summary:

Truth Technologies was founded in 1996 and is active in the AML/KYC/CTR and anti-bribery sector of the Global Risk and Compliance arena, where its Sentinel application, coupled with the World Check data-file is serving almost 200 customers from small boutique firms to Fortune 500 giants across the world.

Truth Technologies, Inc. is presently setting up its core IT team for the future.

The success of the candidate is therefore essential for the future of the company. It is very important to emphasize the need, not only for excellent technical skills, but also for team-skills since that is key to integrating the small team in-charge of managing the company. Transparency and a pro-active willingness to share information are essential.

On the technical level, Sentinel is a SaaS application spread over several data centers across the world: US, Cayman Islands, UK and Germany. Some of them are cloud servers and within those, some are AWS servers. The IT Support Operations are led from Luxembourg with which daily contacts are required. The Sentinel application has been developed under Unix using the Java programming language, JBoss middleware and Oracle database management. The application is spread over several servers and with that, several different versions of the key software components. Migration skills/experience will therefore definitely be mandatory.

In addition to that, the skeleton of an upgraded version of Sentinel (known as Version 2 or V2) is almost ready to enter into an early testing phase. It is based on the Google Cloud suite of tools. When it will become ready for roll-out, customers enjoying the previous version will need to be migrated to the new environment with a minimum of disruption in the availability of the service.

The role is a very wide-ranging one and a very open one and so the successful candidate will be one who relishes being given the freedom to connect to all servers and all applications with full privileges. But with freedom comes responsibility and the successful candidate will also have to show that they understand the importance and the seriousness of the task. In part this will mean documenting the tasks they undertake and sharing information throughout the small team.

The team will be growing as the need arises, therefore the candidate could grow with it, expanding their skill-set, keeping pace with future developments, including Sentinel Version 2.

The required technical skills are:

- A) Support the existing Sentinel and perform migrations and updates as required

Role: Senior IT Expert

Primary skills:

- Java
- JBoss

- Linux/Unix
- Web Development
- Git
- IT Security
- Development skills: developing additional functionality and bug-fixing in the Sentinel application using the existing technology.
- Migration skills: Linux, Java, Jboss, etc, all need to have upgrades, sometimes in cooperation with our Rackspace Datacenters.
- Communication skills: must be able to integrate a small team and be pro-actively open.

Nice to have:

- Oracle: DB system that is underlying the Sentinel application.
- Informatica: The core of the Sentinel application's Names search engine.
